Brightspeed Call Analytics

Usage Guide (with screenshots)

This guide walks through the Streamlit UI for tagging Billing and Payments call data with the governed 104-leaf taxonomy. Use the in-app button Download usage guide (PDF) anytime to get this file.

Open the app

Primary (LAN): http://192.168.27.200:8501

External / public IP: http://35.255.217.177:8501

Bookmark the primary URL for day-to-day use. If the page does not load, confirm Docker is running (docker compose ps) and that firewall rules allow TCP 8501.

Contents

- 1. Analyze calls - upload data, BP/DNI toggles, start tagging
- 2. Filters - optional advanced column filters
- 3. Results - live status, logs, downloads, cleanup
- 4. Tips and troubleshooting

1. Analyze calls

Start here to upload Excel workbooks, set Billing/Payments and DNI scope, pick files, and run tagging.

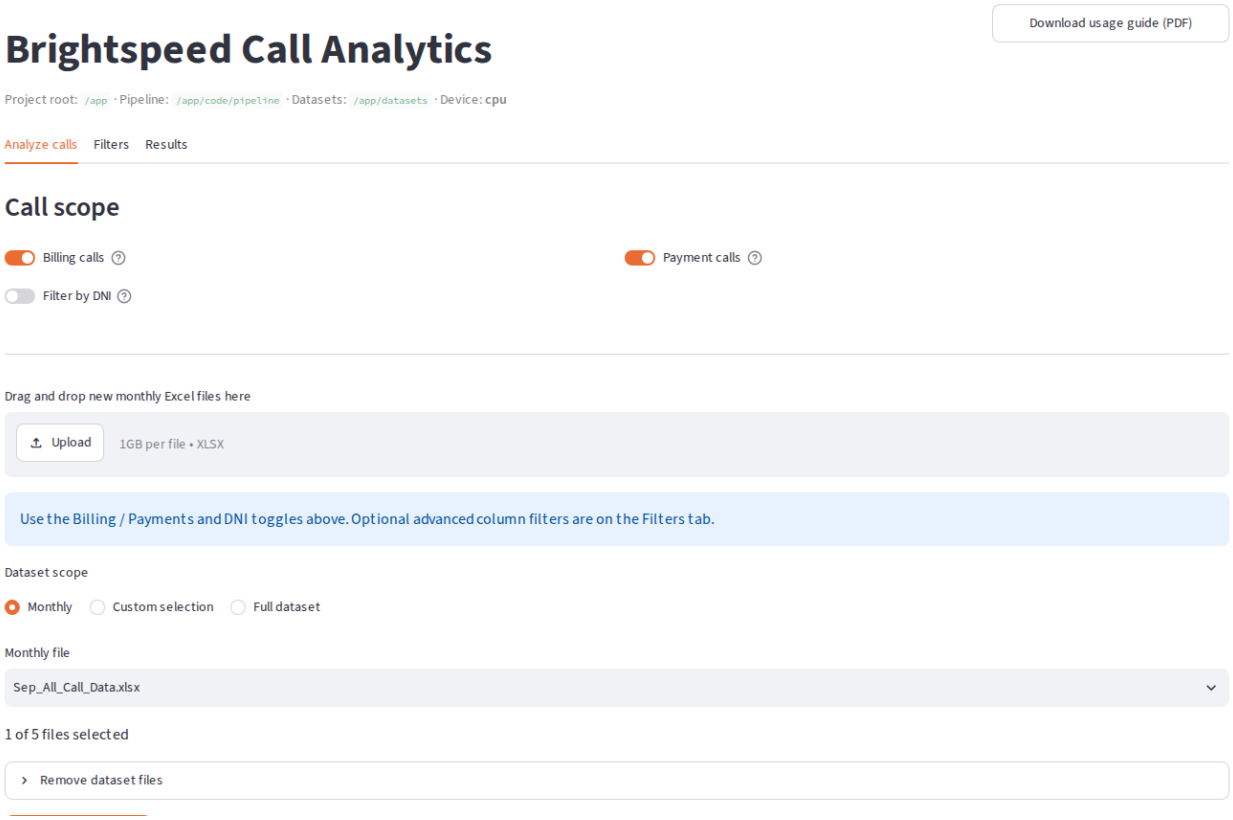

Figure 1 - Analyze calls tab: Call scope toggles, upload zone, dataset scope, and Analyze button. Open: http://192.168.27.200:8501

Billing / Payments and DNI toggles

- Billing calls / Payment calls - keep rows by Primary Call Reason. Leave both on for the default Billing+Payments scope.
- Filter by DNI - when on, enter one or more DNIs (comma or newline). Matching ignores case and surrounding spaces.

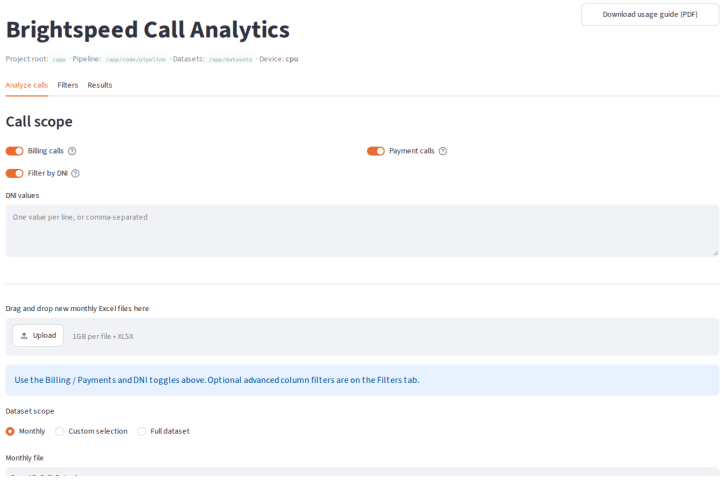

Figure 2 - Filter by DNI enabled, showing the DNI values box under Call scope.

Then choose Monthly / Custom / Full dataset, optionally remove old Excel files, and click Analyze and add tags. Progress appears on the Results tab.

2. Filters tab

Optional advanced filters for columns such as BAN, Account Type, Network Type, and Queue Category. Enable a checkbox, then enter allowed values. Empty enabled filters block Analyze until you add values or uncheck the column. Billing/Payments and DNI controls stay on Analyze calls.

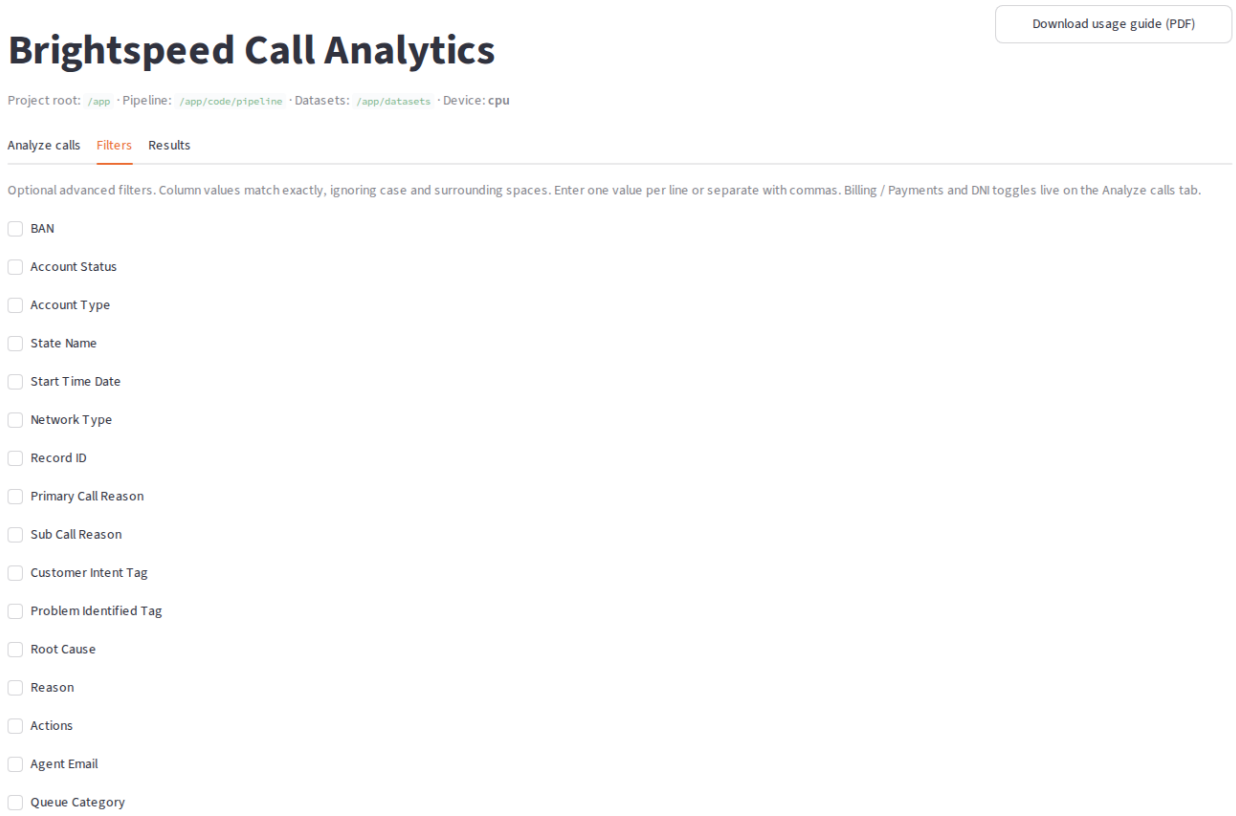

Figure 3 - Filters tab with advanced column checkboxes.

Go to app: http://192.168.27.200:8501

3. Results tab

Monitor runs with Auto-refresh (updates about every 2 seconds), inspect the processing log, download tagged Excel, and remove finished runs.

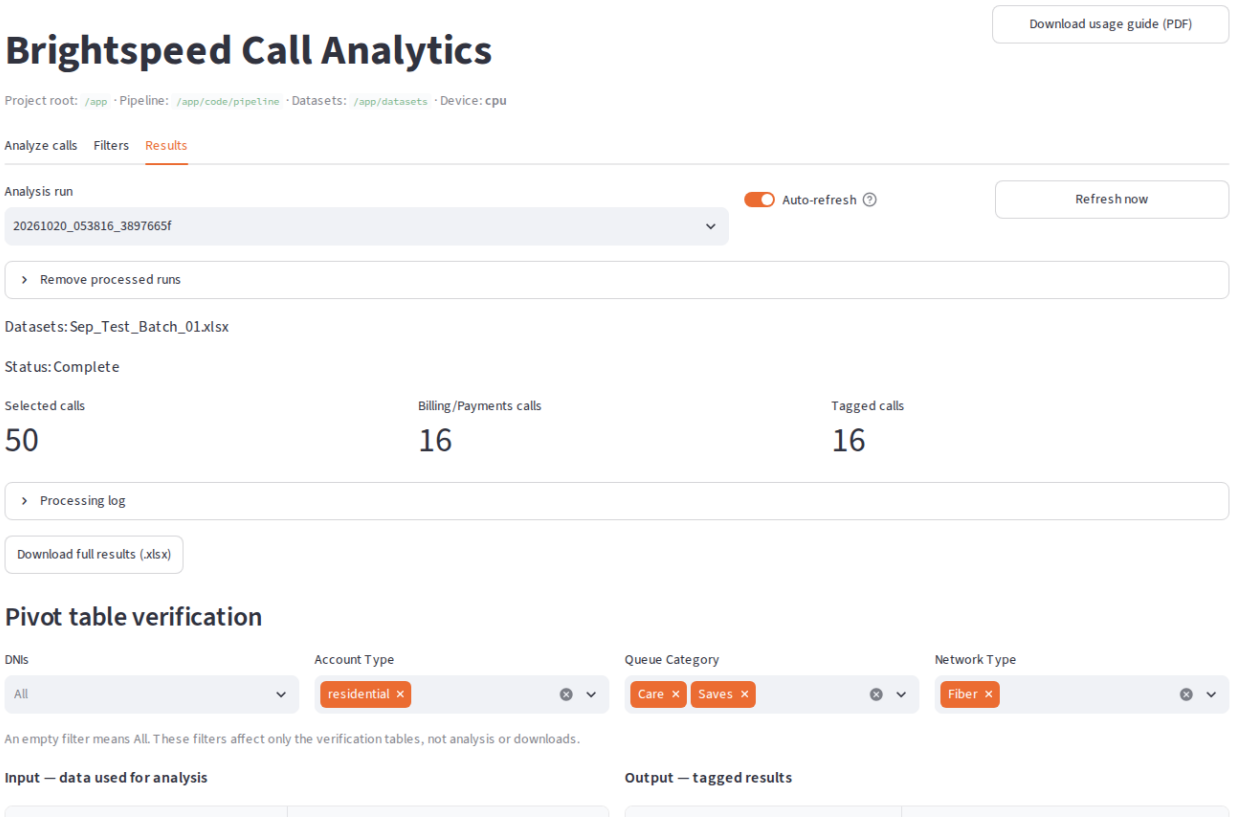

Figure 4 - Results tab: run selector, Auto-refresh, metrics, download, and pivot verification.

- Auto-refresh - leave on while a run is active so logs stream without manual refresh.
- Remove processed runs - permanently deletes finished ui_runs folders.
- Download full results (.xlsx) - available when Status is Complete.

Open Results in browser: http://192.168.27.200:8501

4. Tips

- Frozen taxonomy vectors live in code/artifacts (coverage_leaf_protos.npy) so tagging skips a slow rebuild.
- Embedding batch size is 1000; give the VM several GB of RAM on CPU hosts.
- Upload rejects duplicate filenames and sheets missing required columns.
- Docker CPU start: mkdir -p datasets && cp testdata/*.xlsx datasets/ && docker compose up --build -d
